

AMENDMENTS TO THE ABSTRACT:

Delete the current Abstract and replace therewith the attached replacement Abstract of the Disclosure.

1 An online digital photograph processing system allowing a customer of a lodging
2 house to receive and see a photograph captured by a rented digital camera through a
3 television (TV) or other means. A customer rents a digital camera terminal that has the
4 capability to wirelessly transmit a digital photograph along with a terminal's
5 identification number to an access point device which in turn transmits the photograph
6 to a central management center. The central management center generates a user
7 identification number of the customer; stores and correlates it with both the terminal
8 identification number and the identification number of the room assigned to the
9 customer; stores the received digital photograph; and, in response to a photograph
10 projection request from the customer transmits the image data to an Internet television.
11 A photograph editing device allows the customer to edit the digital photograph stored in
12 the central management center.
